Caring for our Water

Caring for our Water program equips plumbers with the latest knowledge and skills to advise you on domestic water audits, home inspection reports, water quality, caring for our waterways, stormwater, sewerage, water efficient products, new developments in technology (rainwater, recycled water, greywater), government incentive/rebate schemes, permanent water saving rules and recycled water opportunities for both domestic and commercial applications.

Water Efficient Technology

This program covers rain water harvesting considerations, size, location and use for rain water tanks, rain water flushing toilet systems, gravity feed systems/pump systems, domestic greywater use (do's and don't's), greywater treatment systems, environmental and public health issues, potential water savings planned for now or the future, sewage treatment systems and septic tanks, State/Territory Government water rebates and local water restrictions information.

Climate Care

Climate Care focuses on hot water heating, heating and cooling, greenhouse gas reduction, customer service and energy Star Ratings (electric and gas). The program also looks at how plumbers can assist householders in the decision process when replacing or purchasing hot water heating units and domestic heating and cooling appliances.

Solar Hot Water

Ask your local GreenPlumber® for help in choosing the right solar hot water system for your needs that will not impact greatly on your lifestyle, including: size, capacity and personal hot water requirements, existing energy use, environmental issues, potential energy savings planned for the future, home inspection reports, cost comparisons between different energy sources and State/Territory Government water rebates.

Inspections and Reports

Domestic - An accredited GreenPlumber® can assist you in determining the most efficient products and appliances for your current and future needs – this environmental home inspection report will develop a staged plan for reducing your water and energy costs while also improving the environment for everyone.

Commercial - The GreenPlumber® 50 point Schools and Commercial buildings environmental plumbing report has been created to assist schools and small commercial businesses in assessing the volume of water used. The report will also show the state of a school or businesses water fixtures and to provide recommendations on how to make substantial water, energy and money savings. A GreenPlumber® can carry out an assessment and make relevant recommendations for your school or business.

Water Module refresher course

This session is not a registered GreenPlumber® module but is designed to provide an overview of issues associated with rainwater tanks and greywater diversion devices, briefly covering topics presented in 'Water Efficient Technology'.
